dřevoterm

Traditional woodworking from the border region

About us

- A Czech family business with a tradition dating back to 1889
- Modern woodworking technology
- Many years of specialization in carpentry and sawmill production
- We emphasize quality, precision, and an individual approach

01 Sawmill production

We offer a full range of spruce lumber for construction, including impregnation and drying.

02 Planed products

A wide range of planed products allows for the implementation of any project.

03 3D decking

3D decking brings aesthetics and originality to your spaces

Construction timber and planed products

The Meziměstí sawmill provides complete production of construction timber with drying and impregnation. Modern operation with an annual cut of around 70,000 m3, mainly spruce logs. We also offer a wide range of planed products, e.g. decking, terrace boards, and smooth profiles.

Sawmill production

Since 2007, all sawn timber production (including construction timber) has been concentrated at the Meziměstí Sawmill, where a handling warehouse and a modern sawing line with an annual cutting capacity of 70,000 m3 were built on a greenfield site. Most of the timber processed is spruce logs.

- construction timber, battens, boards, planks, beams
- drying and impregnation

01. Center cut lumber

With a few exceptions, standard-sized construction lumber is usually in stock. Other sizes can be produced up to a maximum length of 8 m.

02. Side lumber

Upon request and with sufficient quantities, it is possible to impregnate sawn timber or dry it in fully automatic drying kilns.

Planed products

The planed products section offers a wide range of profiles and dimensions, allowing you to realize any project or idea, which is sure to satisfy the vast majority of customers.

01. Planed program

The range includes decking for interior cladding and exterior facades, floor boards and decking boards, a wide range of smooth, four-sided planed products, either with sharp edges or with bevelled and rounded edges, which are mainly used outdoors for various garden structures such as pergolas and garden sheds, fences or garden furniture.

02. Modern production technology

3D decking is created at a special milling center using machining heads that oscillate at high speed. This technology allows for the creation of various patterns and textures, from subtle indentations to more pronounced structures, which give the decking a unique character.

New generation decking

3D decking

3D decking is the ideal solution for those looking for a combination of unique design and functionality. In addition to their aesthetic value, they also offer practical advantages that make them the perfect choice for demanding projects.

Modern production technology

3D decking is the result of precise work on a special milling center using a set of milling heads that oscillate on both the vertical and horizontal axes. This technology allows us to create a variety of designs—from continuous to grooved to irregular patterns, including shallow or sharp grooves.

Other assortment:

We process every last bit of roundwood. That is why we also offer loose materials such as sawdust, wood chips, and bark.
We are manufacturers of pressed briquettes and also sell firewood.

Bulk material

We divide wood chips into individual fractions - sawdust, wood chips, coarse pieces.
Our products are ideal as fuel, bedding, or mulch, all non-chemically treated, simply useful.

Packaged briquettes

Dřevoterm is fully aware of the need to protect the environment. One example of this is the production of wood briquettes, which are made by high-pressure pressing of waste sawdust without the use of chemical binders.
Wood briquettes can fully replace coal fuels in terms of their calorific value.

Firewood

Clean wood in the form of cuttings and logs.

Services:

01. Impregnation

If requested and in sufficient quantities, it is possible to treat the sawn timber with LIGNOFIX E-PROFI brown. It is designed for the preventive protection of wood against wood-destroying insects, wood-destroying fungi, and wood-staining fungi and molds. The treatment itself is carried out by soaking the lumber in an impregnation tank filled with a protective solution.

02. Drying of sawn timber

The total capacity of the drying chambers is approximately 300 m3 with a material thickness of 50 mm. There are four drying chambers available (1 x 120 m3, 1 x 70 m3, and 2 x 50 m3). The drying process in all chambers is computer-controlled and checked by operators at regular intervals.

Heat treatment is mainly used for pallets, crates, shipping boxes, or lumber intended for packaging production. Heat treatment involves reaching the required temperature and time at which all harmful organisms in the wood are destroyed.

Contacts

We treat every customer as an important client and give them our full attention. We will be happy to help you choose the right product.
